## ABSTRACT

This research aims to describe the important of parental boarding of mother toward teenager girl to prevent early-age of marriage in Ponjong District. This research is qualitative descriptive with data analyzing using interactive model of Miles and Huberman. Technique of data collecting in this research using interviewing, observation and documentation. This research found that 1) the neighborhood subject of early-age marriage is in rural area which are still many fields, as well really silence due to residential area is still rare, 2) the lack of knowledge about health reproduction on a person has early-age of marriage, this case happen since the level of education and the access of information about health reproduction is still low therefore it cause the wrong information or invalid information, 3) an early-age of married happens because they got pregnancy in out of marriage, 4) the lack of mother bounding toward the subject of early-age marriage since some of parents more choosing to leave their family in outside area to earn a living caused the communication or their control toward their children is still less.

**Keywords:** Early-age of marriage, Parental Bounding, Teenager.

## INTRODUCTION

Teenager period is a part of individual life cycle, a period to find out identity. An age where an individual has a process into mature community, therefore a child does not feel his/her position is under level of older people but it feels in same position (Ali and Asrori, 2018). Teenager period occurs in three stages, first stage in the age 12 to 15 years old, second stage is on the age 15 to 18 years old, and third stage is on the age 18 to 21 years old.

Teenager also have rapid development in intellectual aspect. The way they think has been not able yet to integrate themselves into mature community. But in now days is development era which is the most prominent in the cycle of individual life (Shaw and Costanzo, 1985).

Teenage period is often known as the phase to find out their identity, therefore they have been not able to master and function optimally, both their physics and mental. On the physic and mental development of teenager, family have an important role. Family environment mainly parents have an important role or related with the behavior of teenager. Bounding is a relationship occurs between children and parents. It is an individual commitment as well bounding emotionally with family and neighborhood in community (Lee & Look, 2012).

Bounding will give the effect on teenager in their habitual behavior, the number of teenagers with problem occur in the community is one of the factors caused because of the way parents educate in family environment, will affect the characteristics of the teenager (Cheng and Christoper, 2015; Dewi et al., 2019).

Some of negative cases occurs in community which is committed by teenager based on individual internal such as due to their identity and instability of their emotion caused by the lack of parents' concern (Avagianou, 2008; Pangesti

and Tiningrum, 2019). Teenager's negative behavior is not only on the mischiefs they committed in the community, but also hanging out freely can caused pregnancy in out of marriage. Parents having an authoritarian way in educating children can caused children tend to be lying, brave to against parents' order and desperate to committed negative things. Including prohibition to be dating, otherwise they feel challenge to committed what parents prohibit, therefore it can cause free sex and have a pregnancy in out of marriage (Lutfianawati and Ananingsih, 2014; Umaroh, 2015; Najib and Raharjo, 2018).

The effect of promiscuity is having pregnancy in out of marriage and finally they have to having marriage in early age (Kibretb 2015; Mpilambo, et al., 2017; Judiasih et al., 2018). Early-age marriage mean is not appropriate with the child protection law which said that children until in the age of 18 years old (child protection law, 2014), and it is not appropriate with the marriage law 2019 which said that the minimum age in having marriage both men and women is 19 years old (marriage law, 2019). An early-age of marriage many happens in Gunung Kidul Yogyakarta (Tsany, 2015; Hadna and Sumini, 2017). Based on the data from the ministry of religion of Gunung Kidul, Ponjong District is one of the districts with the most of early-age of marriage occur because in 2016 to 2018 the average almost every month there are many cases of early-age of marriage. This case happens due to the pregnancy in out of marriage therefore push them to have early-age of marriage.

## METHOD

This research is descriptive qualitative research. The main informant are five mothers of the subject early-age of marriage, the supported informant are five subjects of early-age of marriage, and for triangulation consists of five public

## Parental Bounding As A Prevention Of Early-Age Marriage

figures in Ponjong district, analyzing data used interactive model of Miles and Huberman.

Technique of data collecting in this research using interviewing, observation, and documentation. Interviewing done by exposing the event of early-age of marriage. Observation done in neighborhood of informant, interaction pattern, and informant appearance when doing the interviewing, and documentation done by reviewing the documents of marriage as well report card.

### RESULT

Based on interviewing result, observation and documentation from informant, the result obtained:

#### 1. Description of Characteristics of Research Informant

The subject informant of early-age of marriage is 100 percent female sex, in age of 13 to 15 years old, religion of Islam and have basic education. The parents of subject of early-age of marriage is 100 percent a mother, religion of Islam, majority of their age are more than 35 years old and have basic education (80 percent). The majority of public figure are male (80 percent) and 40 percent are female. The majority of their age are 46 to 55 years old (80 percent) and one person is more than 56 years old (20 percent), 100 percent are Islam religion, and two of them have basic education (40 percent), one of them has secondary education (20 percent) and two of them have highly education (40 percent), while the work experience as public figure is 100 percent more than 4 years.

#### 2. Research Result

##### a. The Environment of the Subject of Early-Age of Marriage.

All of the subject of early-age of marriage live in rural area, the distance of one home to another house is really far from each other, the neighborhood is still rare, or clustered among 2 to 3 houses, while at the right and left side of the environment is vast fields. The closest distance is about 200 meters. The condition of roadway is still highlands. The internet network still has a problem, cause the lack of media access. Having electrical power but it is still minim for lighting in public place. The subjects live in a group community in prosperous family stage 1, even there still house with dirt floor and close with cattle pen. The community of Ponjong district tends to leave their hometown to looking for better job to increase their prosperity of family economy. Education level of junior and high school is still minimum or minority. As describe in one of the interviewing result below: "... there are many of Ponjong people work in out-side of area and there are many divorce couple and leave their children in their grandparents or orphanage" (N12).

##### b. The Lack of Knowledge about Health Reproduction in the Subject of Early-Age of Marriage.

The level of knowledge about teenage health reproduction specially in the subject of early-age of marriage is still lees, they only got the knowledge about health reproduction when they are in primary school and at the beginning of junior high school. They also did not access the information about health reproduction from any media. Therefore, by the lack of the knowledge makes them easy to be seduced or being convinced by the opposite sex to be having sexual relation before marriage. As conveyed by one of the subjects of -early-age of marriage, she assumes that if she only ones having sexual relation does not cause the pregnancy. But the fact, though in ones, it still causes the pregnancy. Related with the interviewing result below:

- P : well, miss Denis, have you ever heard the knowledge about health reproduction?  
I : Not Yet.  
P : how about in school?  
I : Not yet,  
P : Never?  
I : never, (N2)

- P : well, when did you know that you are having pregnant? How?  
I : I didn't get menstruation  
P : how long?  
I : for six months. I thought I just got late, and I forgot that, but finally I check it and found that I got pregnant. Because I thought I only have sex ones. (N5)

##### c. The Incident of Early-Age of Marriage by the Subject

The early-age of marriage in Ponjong district happens due to the pregnancy of out of marriage. 80 percent of them is still junior high school students and there is one only graduated from elementary school. The incident of having sexual relation is at the subject's house herself, and before, they have promise to meet and date at the subject's house since nobody at home. Her parents are busy working at field and other family member are also busy with their own activities. Some of subject having sexual relation in many times therefore cause the pregnancy in out of marriage. Their family did not know about that accident, in finally it is known when the pregnancy got five months. And the tragic thing is their parents know about their daughter condition from another people (not from their member of family). The incident is conveyed to the local public figure for making decision based on the discussion to have their responsibility for their act by proposing the process of marriage dispensation in the religion court through the process from level of neighborhood association first. The interviewing result shown below:

- P : Sorry, where did you having sexual relation? How many times?  
I : at home  
P : whose home?  
I : friend's home, that boy, Tegar, (N3)
- P : where did you do it (having sex)?  
I : at home,  
P : whose home?  
I : here  
P : how many times?  
I : ones, mom.  
P : aren't your parents at home?  
I : no, when they left home (N5)  
P : wait, what is that?  
I : oh, neighborhood association, Citizen association, village chief, in this village, this district, court, in Wonosari.
- P : Oh, what kind of trial, Mom?  
I : three days of trial. (N6)
- P : Okay, well. Have you ever known about the incident happen to miss Andi, sir?  
I : Yes, I have,  
P : Okay, maybe you can tell, did you report to the neighborhood chief or how did the process before they got married, sir?  
I : we didn't report anything before married, there was no communication. We did a report after got known that our daughter got pregnant. (N11)

##### d. Mother Bounding toward the Subject of Early-Age of Marriage

The subject of early-age of marriage, not all of them live with their parents. Because of the economic condition, their parents leave the village for work. Although as a mother, with the husband's permission they leave home for work and only come home in ones a week or ones in a month. While her husband is also busy managing their field, working from the morning until evening even until night due to have to sell

their rice yield to out of area. All of the subject of early-age of marriage said that they have never told their private problem to their family, even with their mother, even they tend to be believed with their friend to tell about rather than their family.

P : Miss. Bila, with whom you believe to tell your privacy?

I : No one, I don't believe anyone to tell. (N3)

P : So, just yourself. Have you often shared with your parents? Like tell your problem or something?

I : No.

P : Never?

I : Never, (N5)

One of the causes, the lack of parents' control and accompaniment and the level of parents' education which still low mainly for a mother that only graduated from elementary school. They only give fully believe to the teenager that they assume being mature as well are able to differentiate both good and bad, as well they do not against the norms when they are dating. This case makes teenager especially the subject of early-age of marriage feel free to doing any activities both out and at home. Communication between children and parents is not optimal since for parents the main priority is giving physical need which is worthy. But they often forget to pay attention to their children phycological need. Most of mother said that they did not know about their daughter's pregnancy, even there is a mother did not know at all what does happen to her daughter due to she works in out of area.

P : So, how about you?

I : I also like that, if I work, I have to stay.

P : So, it means that only your husband is at home?

I : Yes,

P : Are you working in Bantul, Mom?

I : I was working. Then I was visited and told that Danik was pregnant. They told that danik was afraid to visit me so they asked me to went home, well actually I feel forced but I don't know anything else, so I asked for leave because they said that danik must be got married.

P : Are both of you really don't know anything? From whom you know that danik was pregnant?

I : From danik herself, from midwife, checkup (N11)

## DISCUSSION

Based on the research analysis and result, the discussion in this research as viewed below.

### 1. The Environment of the Subject of Early-Age of Marriage

Quite home environment which has many fields surrounding and rice fields which is about 66 percent of land in Ponjong district is dry land. The large of rice field area is about > 7 percent and 30 percent of the large of rice field is rainfed which is planted with various plant such as corns, nuts, and tuber (Ponjong district in number, 2017). All of the subject of early-age of marriage live in rural area with poor economic condition (Hotchkiss, et al., 2016; Mpilambo, 2017; Rumble, 2018).

The condition of the environment which is quit and lies in the middle of field as well other family member have their own activities makes a big chance for the subject to doing the

things they shouldn't do before got married. Feeling alone and need someone to be accompaniment and also teenager's need push them to be able to have special person to avoid feeling loneliness. The interest of opposite sex while at the beginning is only as a friend, since she feels comfortable and caring by someone, her feeling changes to be a deep love (Faltýnková, et. Al., 2017; Ali and Asrori, 2018). At the puberty stage, for a teenage girl, by receiving seducing, interesting presents from her opposite gender as well the condition of her environment, their flare-up and emotion arise and trying to doing something new they have never done before, and all those action are committed on the basis of like each other or in the name of love (Nurchayani and Satriyandari, 2015; Juliyatmi, Sudargo, and Ismail, 2017).

### 2. The lack of Knowledge about Health Reproduction in the Subject of Early-Age of Marriage

The knowledge is an important element in shaping someone's behavior, especially for teenager, the lack of knowledge about health reproduction caused they are imprudent and following momentary will due to their desire on the puberty stage without considering its bad effect. The material about health reproduction is the things should be known by teenager girl. The dangerous things will happen, if they have free sex. Their knowledge about the effect of early-age of marriage such as caused the baby born with low weight, the risk of cervical cancer, as well the risk of contracting the infectious disease (Sofi, A.M 2017; Rahman, et al., 2018). The information about health reproduction they access is only obtained from teacher in school and based on the myths existed in the large community. This knowledge has strong relation with how someone behave. Those who have an early-age of marriage have minimum knowledge about health reproduction, and it causes they having sex before having marriage. They did not consider at all the bad effect of having sex before having marriage they have done (Yao, et al., 2016; Vananda, Simarjeet and Manisha, 2017).

The lack of their knowledge is a part of their selfishness since they only want to show love and did not want to lose their partner by having sex before having married. The minimum knowledge having by teenager about health reproduction makes them more believe on mislead things. The knowledge which is invalid makes them have desire to trying something they shouldn't do (Sunaryo, 2004; Nursal, 2008; Pratiwi and Hari, 2010).

### 3. The Incident of Early-Age of Marriage by The Subject

Having free sex committed by the teenager in Ponjong District is on the age range of 13 to 16 years old. On those age range, teenagers are junior high school students or have graduated from elementary school. The teenager on those age range is a person beginning to find out their identity and is on the emotional development position. Emotion effect more toward the other psychological functions, the emotion shape in having sex before having married because of feeling afraid to be lost someone, deep love and desire such as feeling happy, satisfied, fulfilled feeling and sensory pleasure about how they obtain new things they have never felt before, therefore they can do the same things in many times (Widyastuti, et. al. 2014; Ali and Asrori, 2018)

The marriage they have done due to compulsion and pressure from the family to getting married soon due to their pregnancy which only makes they feel comfortable for a moment. The domestic life they live become a burden for their own parents, both in their daily needs and children caring. Some of them also having domestic violence, there is no responsibility from husband both material and moral, and their wives have stress since they felt sorry for all the incident they have. Unstable emotional condition as well the poor of economic condition cause some household of early-

age of marriage have problem and got divorces (Gage, J.A, 2013; Sofi, A.M, 2017; Groot, Kuunyem, and Palermo, 2018) Family control and communication specially parents are really needed in accompaniment and control of teenagers. The subject of early-age of marriage in Ponjong district are 100 percent committed at home when the situation is nobody at home since their parents work in the field and never controlled well their children activities. Even they tend to be feeling bad to asking many things since they assume that everything is good and give full believe to their children (Nurlina and Laksmi, 2017; Ungsianik and Yulianti, 2017; Aryati, Suwarni and Ridha, 2019).

#### 4. Mother Bounding toward The Subject of Early-Age of Marriage

Bounding is emotional relationship between parents and children. Bounding influent in shaping the attachment of parents and children therefore it become a basic love and shape the characteristics of children that they tend to be able to think every consequence happen toward the attitude and behavior they have done. By the lack or the loss of parents bounding to teenager, so it will loss of consideration from teenager's attitude and positive behavior (Rehman and Butt, 2016; Wijayanti, Haenilah and Fatmawati 2018).

The level of parents' education is only graduated from elementary and junior high school can give the influence of bounding toward their children, the quality of relationship between parents and teenager can be observed from how high the education level of a mother has. The higher level of education of mother, the more positive relationship they have toward their children/teenager. By the high-level education, parents especially for mother can give sexual education to her children, therefore it can be a part of effort giving health promotion (Olarinmoye, Dairo and Adeomi, 2011; Wibisono, Yuliadi and Suwito 2017; Andari, Woro and Yuniastuti, 2019).

Bounding shaping will be easily done if parents especially mother as housewife, she will have more time to be together with her children. While for mother having work in institution or company, they have no many times for her children since they feel tired after working. Mother has different closeness toward their daughter if comparing with father, positive relationship between mother and children can be observed from their interaction, children become more open to share many things and those relationship give positive effect for their behavior (Driscorll and Pianta, 2011; Leen and Lok, 2012).

By fulfilled the bounding of teenager with their parents especially with their mother, so the teenager's attitude can be controlled well therefore it can avoid they having free sex which cause the early-age of marriage. Parents bounding also shape healthy physic on the early age even until they are adult (Arulsubila and Subasree, 2017; Chen, Miller and Brody, 2017).

Some researchers also found that by bounding or good relationship and the way to educate which is not authoritarian can give positive effect toward teenager's emotion and attitude, especially their sexual attitude (Richard, M. 2013; Potard, et, al., 2014; A. Joseph et, al., 2017; McAdams, et al., 2017)

#### CONCLUSION

Based on the analysis result and discussion, the conclusion of this research are: 1) the neighborhood of subject of early-age marriage is in rural area which are still many fields, as well really quite due to the residential area is still rare, 2) the lack of knowledge about health reproduction on a person has early-age of marriage, this case happen since the level of education and the access of information about health reproduction is still low therefore it cause the wrong information or invalid information, 3) an early-age of

married happens because they got pregnancy in out of marriage, 4) the lack of mother bounding toward the subject of early-age marriage since some of parents more choosing to leave their family in outside area to earn a living caused the communication or their control toward their children is still less. The early-age of marriage can be avoided if the bounding of parents especially a mother performed optimally.
